

Trustworthy Tech & AI

Dr. Chaesub Lee

**Director of the ITU
Telecommunication Standardization Bureau**

Trust in Tech domain (1)

- ❑ The word “**Trust**” is used to describe in concept the relationship between the objects, including human relationship.
- ❑ However, the word “**Trust**” is being used in **engineering level** such as **identifying one of categories** of communicating between objects and human. Getting more attention today.
- ❑ ITU-T studies on the issue how to identify and build “**Trust environment**” in **ICT domain**.
- ❑ Currently ITU-T has **304 Recommendations** related with Trust in various series: F, J, P, Q, X, Y series
 - ITU-T Rec Y.3051: Basic **principles of trusted environment** in information and communication technology infrastructure
 - ITU-T Rec Y.3052: Overview of **trust provisioning** in information and communication technology infrastructures and services
 - ITU-T Rec Y.3053: Framework of **trustworthy networking** with trust-centric network domains
 - ITU-T Rec Y.3054: Framework for **trust-based media services**
 - ITU-T Rec Y.3055: Framework for **trust-based personal data management**
 - ITU-T Rec Y.3056: Framework for bootstrapping of devices and applications for **open access to trusted services** in distributed ecosystems

Trust in Tech domain (2)

- **Definition of “Trust”** [b-ITU-T Y.3052]

Trust is the **measurable** belief and/or confidence which represents **accumulated value** from history and **the expecting value for future**.

NOTE – Trust is **quantitatively and/or qualitatively calculated and measured**, which is used to evaluate values of entities, value-chains among multiple stakeholders, and human behaviours including decision making.

- **Definition of “Trusted environment”** (in ICT infrastructure) [b-ITU-T Y.3051]

An information and communication technology-enabled environment **providing a set of technical and regulatory conditions** sufficient for establishing trust **between interacting entities**.

NOTE – From a broader perspective, the trusted environment can be perceived **as a multidimensional concept** with technological and societal implications.

Trust in Tech domain (3)

Requirements for a trusted environment in the ICT infrastructure

- **Predictability**: All participants within a trusted environment are required to be equipped with the capability to predict the outcome of their interactions
- **Information security**: Each participant is required to be verified for compliance with the common minimal security requirements
- **Interoperability**: support internetwork connections to provide unified interaction capabilities to each participant, independent of technical infrastructure (core networks) used
- **Availability of administration services**: Provision of continuous customer support is required for all interacting participants within a trusted environment in an ICT infrastructure

On the global scale, a trusted environment is not possible in the absence of ICT interoperability.

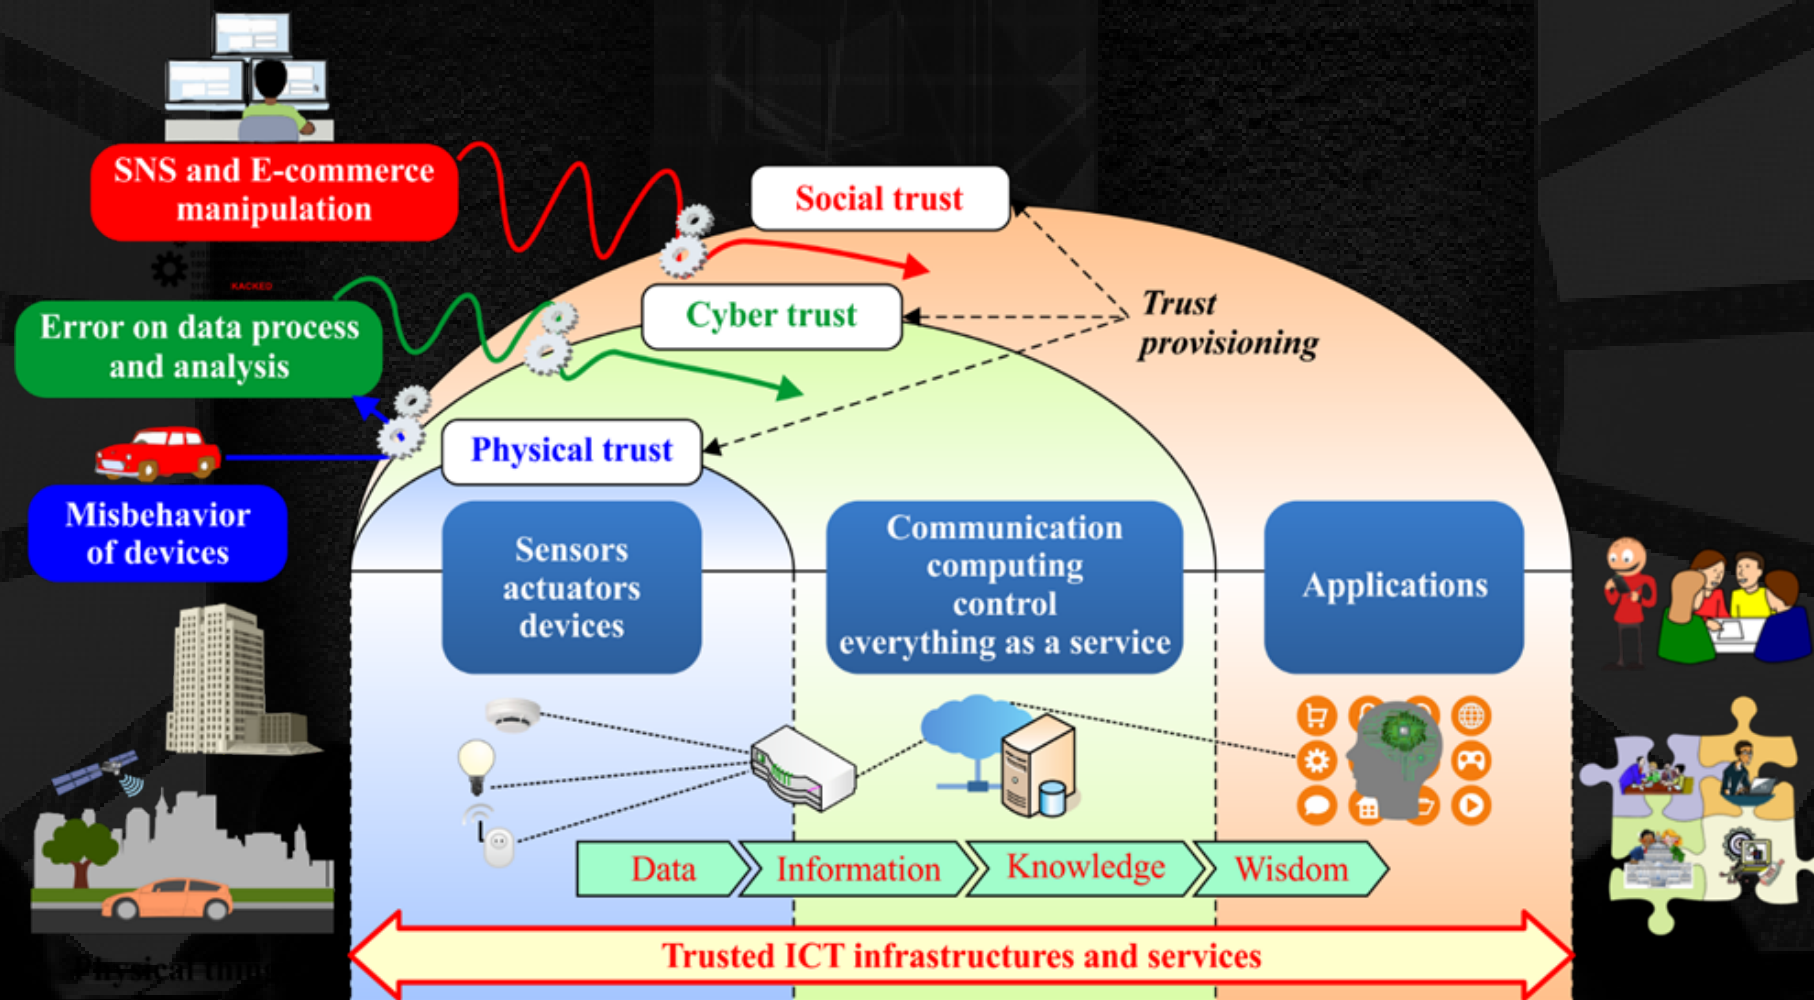

The basic principles for creation of a trusted environment in ICT:

non-discrimination, technological neutrality, functional equivalence, unification, scalability, equal reliability of infrastructure, legalization of electronic document, client-oriented architecture and systematization

Trust in Tech domain (4)

Concept of Trusted ICT infrastructure and Services

Trustworthy of AI (1)

Question 1: Does AI trustworthy?

Basic compo of AI: Algorithm + Data

Efficiency
Neutrality
Transparency

Variety

Differences by many factors:
People, Culture, Location,
History, Application, Usage, and
many others

Integrity
Security
Privacy

Unique

No differences by any factors:
People, Culture, Location, History,
Application, Usage, and many others

Trustworthy of AI (2)

Question 2: What are most influence of AI?

Basic compo of AI: Algorithm + Data for specific services/applications

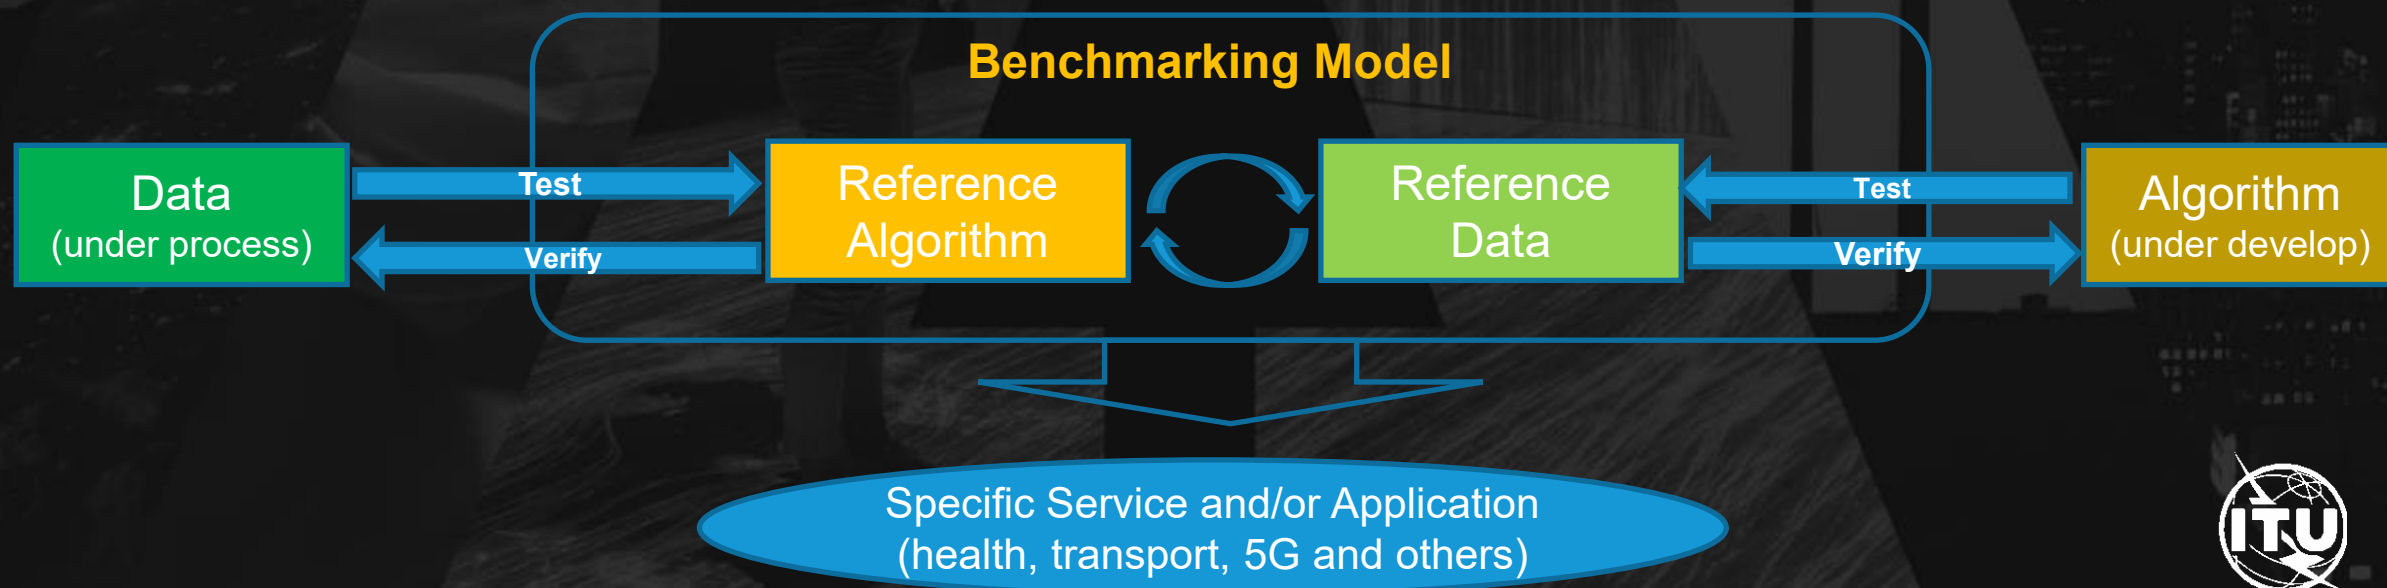

Tailoring for many cases

Challenge

Many Problems and Different Solutions
