Image Classification Framework

Trustworthiness and sustainability

Why does the model say there's a landslide here?

Any bias?

Is the solution reusable?

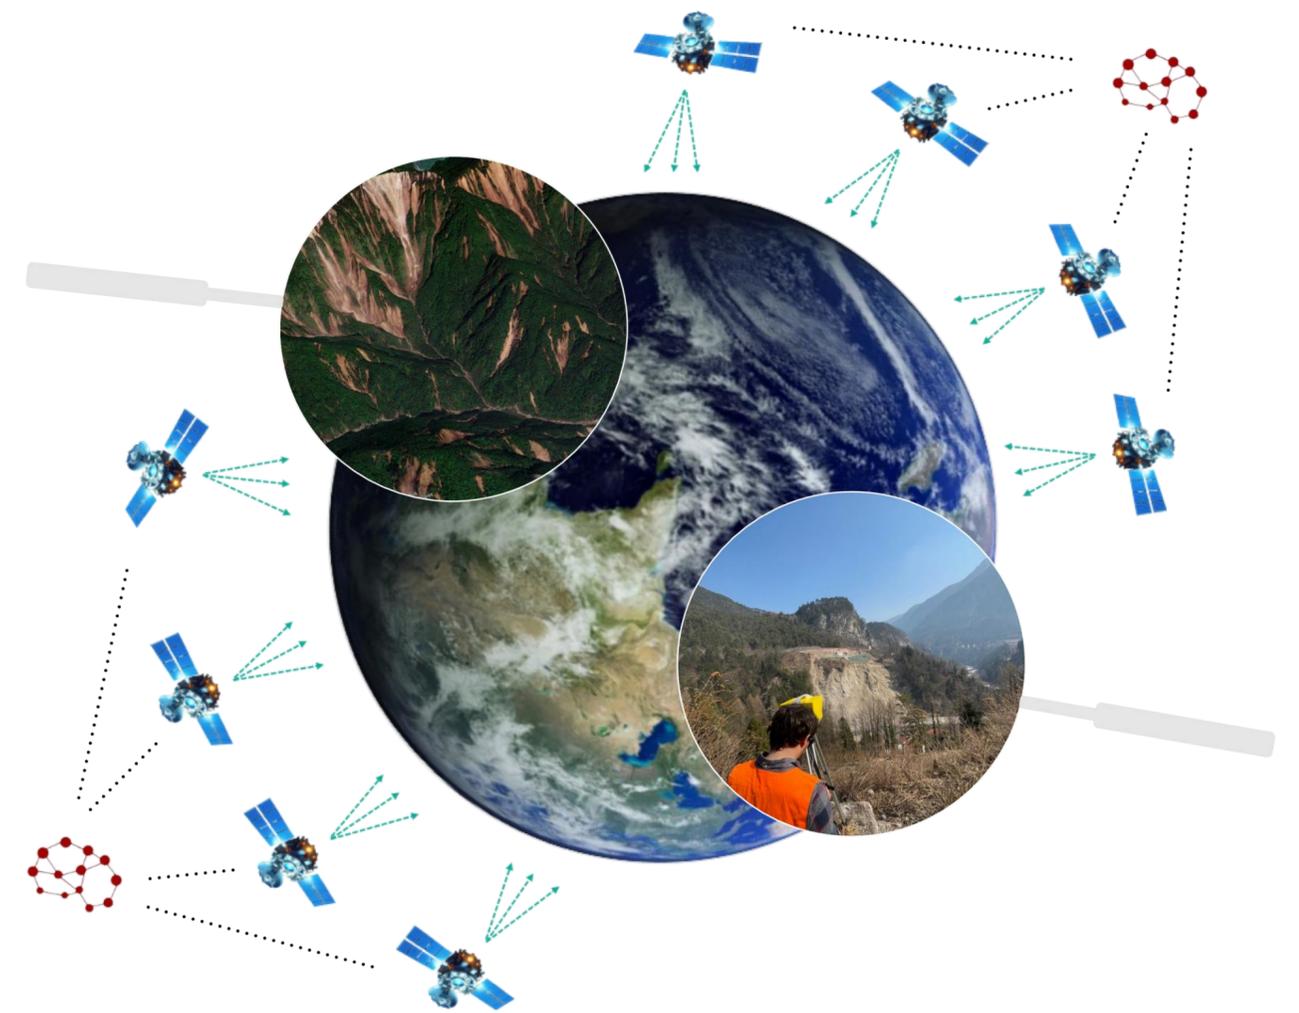

Is it sustainable?

Who is this challenge for?

- Any experience level.
- We provide a starter notebook and resources to guide you through exploring, processing, and analysing the data.

Challenge Objectives:

- Develop methods for **automated landslide detection** using **open-source, multimodal imagery** (both optical and radar) to enable effective, large-scale monitoring and timely identification of landslide events.
- Adhere to **trustworthy AI guidelines** to create solutions that extend beyond performance metrics, ensuring models are **transparent, ethical, and impactful**, with tangible benefits for society and disaster resilience efforts.

Classification for Landslide Detection

Can you create a classification model to identify landslides?
